This memo describes the data used in Dan Reiter, "Security Commitments and Nuclear Proliferation," *Foreign Policy Analysis*.

The principal original data collection was of the foreign deployments of American nuclear weapons. The actual codings of the deployments are described in Table 1 of the article. The sources used to construct the deployment codings include the following:

The sources for the other variables are described in the data set. There are brief descriptions of the variables embedded in the STATA data sets.

The empirical analyses can be replicated using two different data sets, a STATA 11.2 data set on nuclear acquisition (reiterfpanucacq.dta), and a STATA 11.2 data set on nuclear pursuit (reiterfpanucpurs.dta).

As described in the article, separation issues may mean that if you analyze these data using the same research design but a different statistical program, you may get different results. All results reported in the article are obtained using STATA 11.2.

Using the acquisition data set:

```

Using the nuclear pursuit data set:
